PROGRAM : Creative Multimedia

DEPARTMENT : Computer and Information Department

SUPERVISOR : Sir Nur Sophian Bin Riffin

### B: PROJECT OVERVIEW

This project focuses on the development of Buah Café website as well as multimedia brand identity. The café is a local Café with two branch outlets located in Bandar Baru Bangi and Eco Majestic. Buah Café website shows the brand identity of the café, the menu offered paid visiting rating, location and operating hours. It also offers services for online bookings, such as table booking, event booking, job applications, sponsorship and membership. A 48 second promotional video was also produced to promote the business of Buah Café. The web-based system was developed with HTML, CSS, JavaScript, PHP and MySQL database through XAMPP localhost development environment. The system was developed with two role system which are admin and staff to ensure ease in acceptance and submission of requests.

### C: PROBLEM-SOLVING APPROACH

This project is aimed at creating a website for Buah Café which integrates product and service promotions to meet customer needs. After the analysis of three problems limited information access, inconsistent engagement, and lack of integrated updates, the objective is to design a website that centralize product and service promotions. The research method follows the ADDIE model. Primary data sources are client consultation with Buah Café through meetings and WhatsApp. Secondary data sources are literature reviews from web engineering journals, UI/UX books, and digital marketing publications. Data collection was conducted through analysis of existing café digital presence which are ZUS Coffee, Starbucks Malaysia, and social media only café pages. The Buah Café website provides solutions including coordinated information and menu without switching between platforms, online forms for reservations, events, job, sponsorships, memberships, and contact, and an autoplay promotional video.

### D: INNOVATION / WOW FACTOR

The objective of this project is to provide Tuah Café with a complete set of software tools to enhance operations and promote its brand. Technically, the website comprises admin and staff pages accessible by role-based access control. The admin can create, read, update and delete web pages, while staff have only read access. Both pages feature an interactive user-friendly interface. Four online forms are embedded for table reservation, event booking, job application, and sponsorship all backed by MySQL database. The homepage includes a 48 second autoplay promotional video. Additionally, branding merchandise for our company including stickers, button pins, lanyards, keychains, posters, and business cards has also been produced. The website tracks all customer submissions through a dashboard.

### E: KEY ACHIEVEMENTS

All three objectives were achieved. Objective 1: fully functional website as Tuah Café using HTML, CSS, JavaScript, PHP and MySQL having a desktop layout and assigned differently user access to staff and admin. Objective 2: The visitor can now get all information centrally on one website, and place online bookings via four integrated forms. Every transaction is stored within the MySQL database. Objective 3: A 48 seconds long promotional video was created and embedded with the website and is sharable via social media channels. The project was successfully transitioned from an unresponsive initial client to Tuah Cafe. Despite this change, the website's content and design were completely revamped, and all assets were completed within the deadline.

## F: IMPACT & CONTRIBUTION

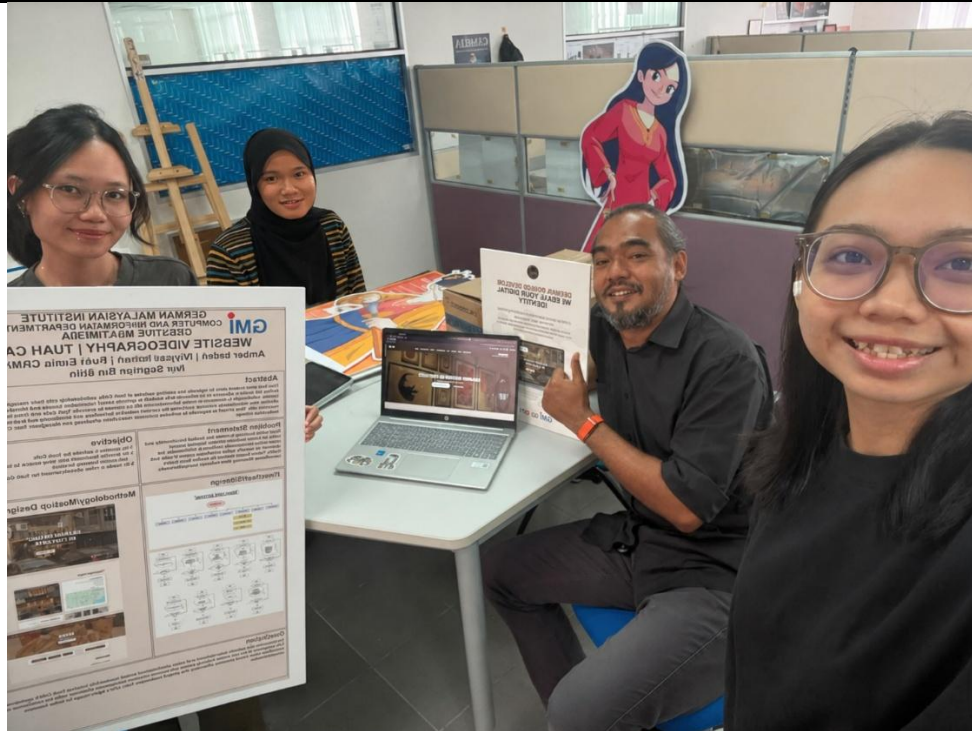

We have redesigned and developed enhanced the existing website for Tuah Café to serve as a centralised platform for hosting the café's menu, locations, opening hours, and customer inquires through reservations. The redesigned website consolidates all unfocused social media platforms currently used to represent the café. Customers can view the full menu, branch locations, and operating hours, and submit reservations through the website, reducing time spent manually responding to Instagram messages. A promotional video has been added to the website to improve brand visibility. For café personnel, the admin dashboard displays all customer responses with complete CRUD functionality. Staff members can view data, but viewing staff management is restricted. Overall, this enhanced website can serve as template for other local cafes wanting to offer customer engagement through a digital interface without relying on costly third-party media.

## G: PROJECT QR CODE

This URL will only function when the XAMPP server is running on the development laptop and the website is accessed from the same machine. For the purpose of this project submission, the QR code serves as a visual reference. During the live presentation, the website will be demonstrated directly on the development laptop.

### FOR REFERENCE & WRITING SPECIFICATION:

#### Writing Specification

- File format: Microsoft Word (.docx)
- Language: English
- Word limit: Maximum 150 words
- Font: Arial
- Font size: 10

The Tuah Cafe website is a web-based system that was created to progress the cafe's online presence and to assist customers to make a reservation. Customers can have access to the menu, the location of the branches, operating hours and make an online booking. The website is made up of HTML, CSS, JavaScript, PHP and MySQL. It was built for desktop and also with a role-based access feature for both staff and admin. Submissions regarding reservations, events, job opportunities and sponsor are stored in a database. A video has been embedded on the homepage with a duration of 48 seconds. This project improves the convenience for the customers and assists the cafe to better manage the submissions.
